

Attendance:

Brenden Mattenson

Maddux Houseman(Online)

Adolfo Lopaz Villanueva

Time: 2:30-3:05

Topics discussed:

- Check in on:
 - Meet with client and confirm the language however, it will be a web application
 - Possibly putting it into NAUGO
 - Tech feasibility: are we able to actually do this:
 - Do we all know how to contribute to the project
 - What challenges could come up while working on the project
 - If someone does not know certain things that are required:
 - Figure out how to work it out and either have them learn how to use it on their own time to a competent degree or help them through it for the first time.
 - What could happen if the GitHub repository is overwritten when it should not have been, and progress is lost.
 - Being able to actually gain access to the NAU database so students can log in with IDs
 - List Challenges, explain why they are important and what struggles it could lead to, and the most effective way to solve it we can find
- Engineering fest- oral presentation of project, just a wireframe
- Reading week- Tech demonstration of working prototype; learn what we need to know to be able to explain everything and to be able to create a minimum viable product to present it.
- Sponsors are also grading based on how we are working with them, how satisfied with our product, and how happy they are while working with us.
- Prepare for peer evaluations and going over the way to complete it due next Friday
